## Apollo RP-125 Repeater

### Programming Overview

The Apollo RP-125 Repeater will Normally be Programmed by WaveWare when you Order Directly from us and Supply us with the Information Required to Program the Repeater.

When Programmed by WaveWare, the Repeater will have a "Label" on the Front of the Repeater with the "Frequency and Watts". If No Label, then WaveWare did Not Program the Repeater

Tech Support is Given by the Dealer or Company who Sold the Repeater

Shown Below is a "Typical" WaveWare Configuration Screen

Repeater--C:\Program Files (x86)\Gold Apollo\Repeater\Bob Default.tbl

File Program About

**Serial Setting**  
COM Port: COM1 [Link] [Reset]

**Frequency**  
Range Of Frequency: 440 MHz - 470 MHz

**Channel | Config**

**Channel 0**  
RX: 4646250 00Hz TX: 4646250 00Hz Source: NB\_MOD Hi-Lo Power: Lo

**Blocking Address**  
 Blocking Address Enable

Addr #1: 0608120	Addr #4: 1234567	Addr #7: 0000010	Addr #10: 0000009
Addr #2: 0608992	Addr #5: 1234564	Addr #8: 0000050	Addr #11: 0100000
Addr #3: 1234560	Addr #6: 1234565	Addr #9: 2097144	Addr #12: 1500000

**Lower Limit Address** Addr #1: 0000009

**Upper Limit Address** Addr #1: 2097144

Multilayer  
Layer: 0

**Delay** Delay #1: 0 \*250m sec.

**S\_RSSI** S\_RSSI: 90

**Command Address** 0617284

**Setting**  
 Invert Polarity(TX/RX) Baud Rate(TX/RX): 512 bps

Ready....

The “Basic” Fields that Normally Require Programming are:

- RX Frequency
- TX Frequency
- Source
- Hi-Lo Power
- Pager Baud Rate
- S\_RSSi Value

The screenshot shows the 'Repeater' software interface with the following fields highlighted in red boxes:

- RX Frequency:** 4646250 00Hz
- TX Frequency:** 4646250 00Hz
- Source:** NB\_MOD
- Hi-Lo Power:** Lo
- S\_RSSi:** 90
- Baud Rate (TX/RX):** 512 bps

Other visible fields include: COM Port (COM1), Range Of Frequency (440 MHz - 470 MHz), Blocking Address (12 addresses), Lower Limit Address (0000009), Upper Limit Address (2097144), Delay #1 (0 \*250m sec.), Multilayer (Layer 0), and Command Address (0617284).

The Other Fields Not Listed above should “Not be Changed”, except for Rare Occasions

**Explanation of the “Marked” Fields**

The RX Frequency: Enter 7 Digits - Has to Match the TX Frequency of the Main Transmitter On-Site

The TX Frequency: Enter the Same Frequency used in the RX Frequency Field

The Source: Must Match the Main Transmitter – If that Transmitter is Narrow Band, then Enter NB

Hi-Lo Power: Strongly Suggested that you use Low Power, for a Smaller Coverage “Overlap” area

Baud Rate (TX/RX): Must Match the Baud Rate of the Pagers used with the Main Transmitter

S\_RSSi: Default is 90 – Some Installs will Require a Different Value for the Repeater to Work Properly

# WaveWare Technologies, Inc.

*"We Deliver Information at the Speed of Light"*

## Apollo RP-125 Repeater

---

### *Basic Programming Instructions*

If Purchased from WaveWare, the RP-125 includes: A CD with the Repeater Programming Software, the RSSi Software, and the Program Manual. Also Includes: A Serial Cable, Power Supply and Antenna.

It is **"Highly Recommended"**, if you are going to make any Changes to the Repeater Programming, that you **"Read"** and **"Save"** the Existing Program Before making Changes, as a **"Back up"** (Default).

Both of the Repeater Software Programs are in **"Zip Format"**.

A Trial Copy of **"WinZip"** is also included on the CD, if you need it.

Unzip the RP-125 Software Program **"First"**, as it may be all that you will need.

The RP-125 Software allows you to **"Program and/or Edit"** the Repeater's Configuration.

The RSSi Software Program is **Only** to be used when the Repeater is Not Sending out a Signal and you are totally sure that All other Programmed Fields are Correct.

The RSSi Program will **"Listen"** to the Surrounding Area and give an **"Average RSSi Value"**.

---

## **VERY IMPORTANT**

The RSSi Program **MUST** be used with the Repeater Mounted **EXACTLY** where it will be used for it to be Affective, or the Program will give a **"False"** Reading / Value.

So you have to take the Program to the Repeater, not the Repeater to the Program. In other words, this Program needs to be installed onto a Laptop so you can take it to where the Repeater is installed.

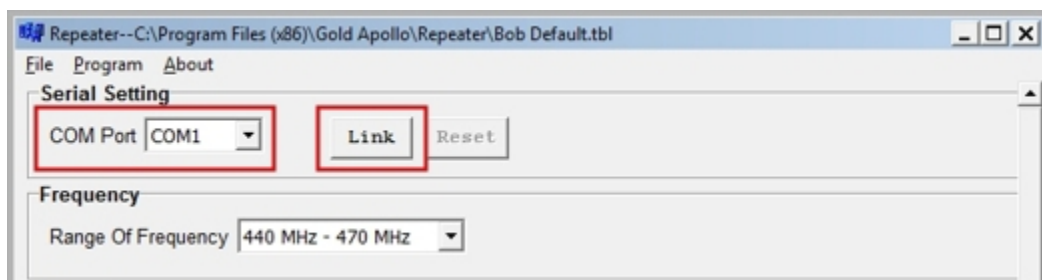

## Apollo RP-125 Repeater

### How to Program the Repeater

To get started...

Attach the Repeater to the PC or Laptop via a RS-232 Standard Serial Cable (Included)  
Power-up the Repeater and Start the Repeater Software Program

Choose the Com Port, Click on the "LINK" Button and Immediately Cycle Power to the Repeater

After Cycling Power to the Repeater, you will Notice that the 2 LED's are on steady.

When "Both" are lit up, the Software is "Attempting" to Connect.  
When the Red LED (TX) goes out, you should see: "Connection Success".

You should see the Following Screen Shots:

While Attempting to Connect

When Connected Successfully

If the Connection "Fails", Check Com Port and Cable and/or "Restart" the Computer and Try again.

**\*\* IMPORTANT \*\***

**NOTE:** Having a "Successful Connect" Does **NOT** mean that you have "Read" the Repeater.

It **ONLY** means that you have "Established a Connection".

You now Have to "Read the Repeater", before making any Changes. **This is Important!**

## Apollo RP-125 Repeater

### How to Program the Repeater...Continued

#### Read the Repeater

To "Read" the Repeater, Click on the word "Program" in the Menu and then Click on "Read".

(You can also just Press the "F3 Key" on the PC Keyboard)

#### Read the Repeater

#### Read Success

Click "OK" to Continue

### Enter the Frequency (RX and TX) and Set Source and Power Level

-The RX and the TX Frequency Field:

**MUST** match the Main Paging Transmitter On-Site

Do NOT Enter a Period (464.6250) in this Field, Enter as Shown (4646250)

-The "Source" Field:

**MUST** Match the Main Transmitter

Set the Repeater "Source" for Narrow Band (NB\_Mod) or for Wide Band (WB\_Mod)

**NOTE:** All Paging Transmitters are supposed to be set for NB or Converted to NB by Jan. 1<sup>st</sup> 2013

-The Power Field:

It is "Strongly Recommended" that the "Hi-Lo Power" be Set for Low Power (Lo)

Only Set to High Power (Hi) if Low Power isn't getting you the Coverage you need and Only After you have tried moving the Repeater to a another/better location.

Reason is that a Lower Power Output gives a smaller Coverage Area of "Overlapping Signal".

**NOTE:** See Coverage Information Diagrams at the End of this Document for more subject Information

## Apollo RP-125 Repeater

### How to Program the Repeater...Continued

#### Enter the "Pager Baud Rate"

Setting  
 Invert Polarity(TX/RX)      Baud Rate(TX/RX) 512 bps

-The Baud Rate (TX/RX) Field:

**MUST** match the Main Paging Transmitter On-Site

Whatever the Main Transmitter is Programmed for is what this Setting Must Also be Set to.

**NOTE:** This is to Communicate "Over-the-Air" from the Transmitter/Repeater to the Pagers.

This is the "Pager Baud Rate" and you can also get this Information from the "Pagers".

#### Enter the "S\_RSSi" Value

Delay      S\_RSSi      Layer 0  
Delay #1 0 \*250m sec.      S\_RSSi 90      Command Address 0617284

The RSSi Factory Setting is "90" by Default and this Value works for Most Installations

At times the RSSi Value may need to be Changed from the Factory Setting

### Troubleshooting

A Blinking Yellow LED (Not getting any Red LED for Transmission) usually means that the Repeater isn't Working with the RSSi Value Programmed and you will need to Check this Value.

Note: After Programming in a New RSSi Value, you "Must Wait" up to 15 Minutes with the Repeater "Powered-up" before the Repeater is Ready to be used with the New Setting.

If you Do Not Wait long enough you will get the Yellow Blinking LED again.

Entering a New RSSi Value is Next....

## Apollo RP-125 Repeater

### The "S\_RSSi" Value

Delay	S_RSSi	Layer 0
Delay #1 <input type="text" value="0"/> *250m sec.	S_RSSi <input type="text" value="90"/>	Command Address <input type="text" value="0617284"/>

The RSSi Factory Setting is "90" by Default and this Value works for Most Installations  
At times the RSSi Value may need to be Changed from the Factory Setting

### *How the Repeater should Work*

The Repeater should "Send a Page" within 3- 4 Seconds (Max) after the Main Transmitter  
If the Repeater is Not Sending any Pages, the "RSSi Value" may need to be Adjusted.

To Adjust this Value, the Installer Must use the "RSSi Software Program" to get the New Value

**NOTE:** This Value can and most likely will Change for each Installation Location.

-The S\_RSSi Field:

Delay	S_RSSi	Layer 0
Delay #1 <input type="text" value="0"/> *250m sec.	S_RSSi <input type="text" value="90"/>	Command Address <input type="text" value="0617284"/>

### **\*\* IMPORTANT NOTE \*\***

**YOU MUST** leave the Repeater EXACTLY where it is Mounted for this Program to work Properly

This means that the RSSi Software Program Must be Installed onto a Laptop so you can take the Laptop to the Location of where the Repeater has been Mounted.

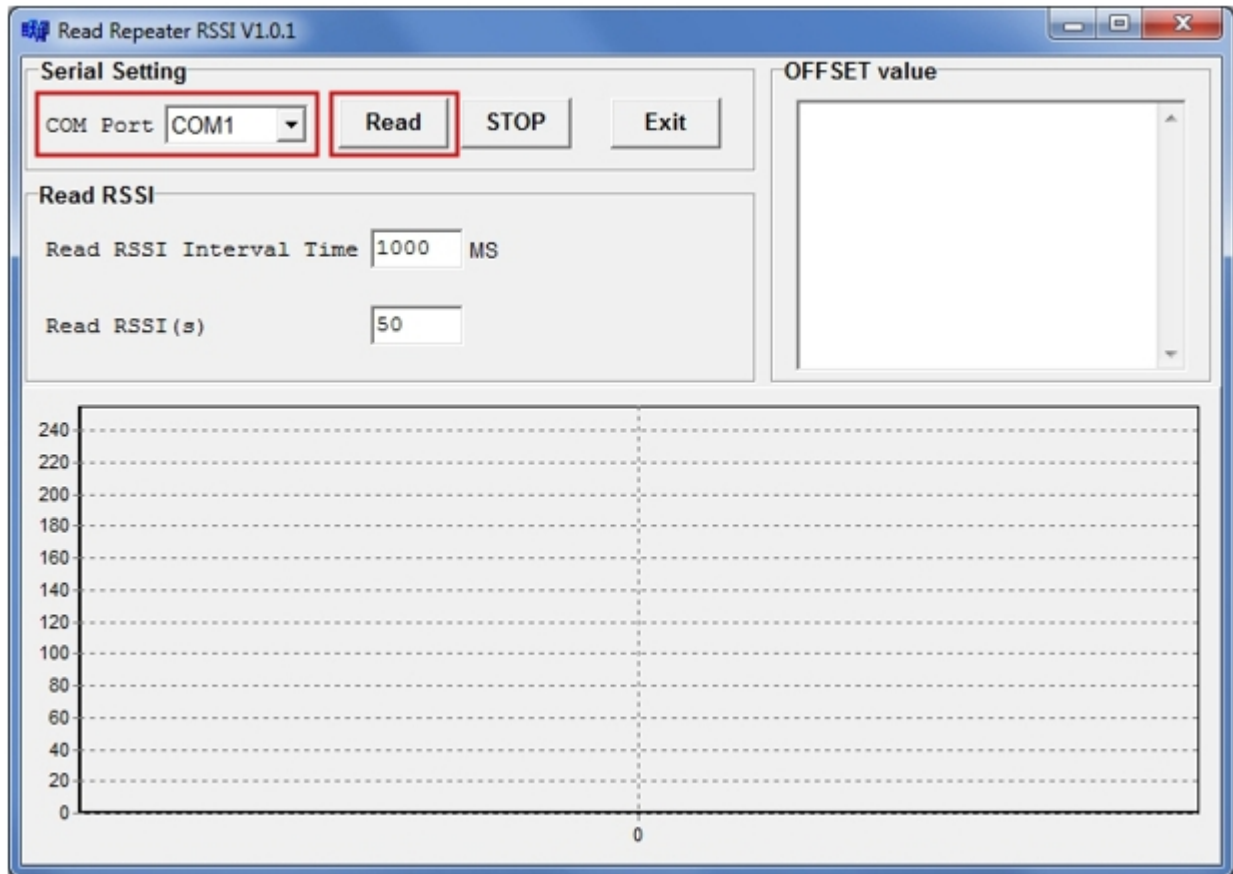

---

How to get a New RSSi Value is Next....

## Apollo RP-125 Repeater

### How to get the New RSSi Value

RSSi Software Screen – Ready to Read

Choose the Com Port on the Laptop for which the Repeater is attached.

Click the "Read" Button.

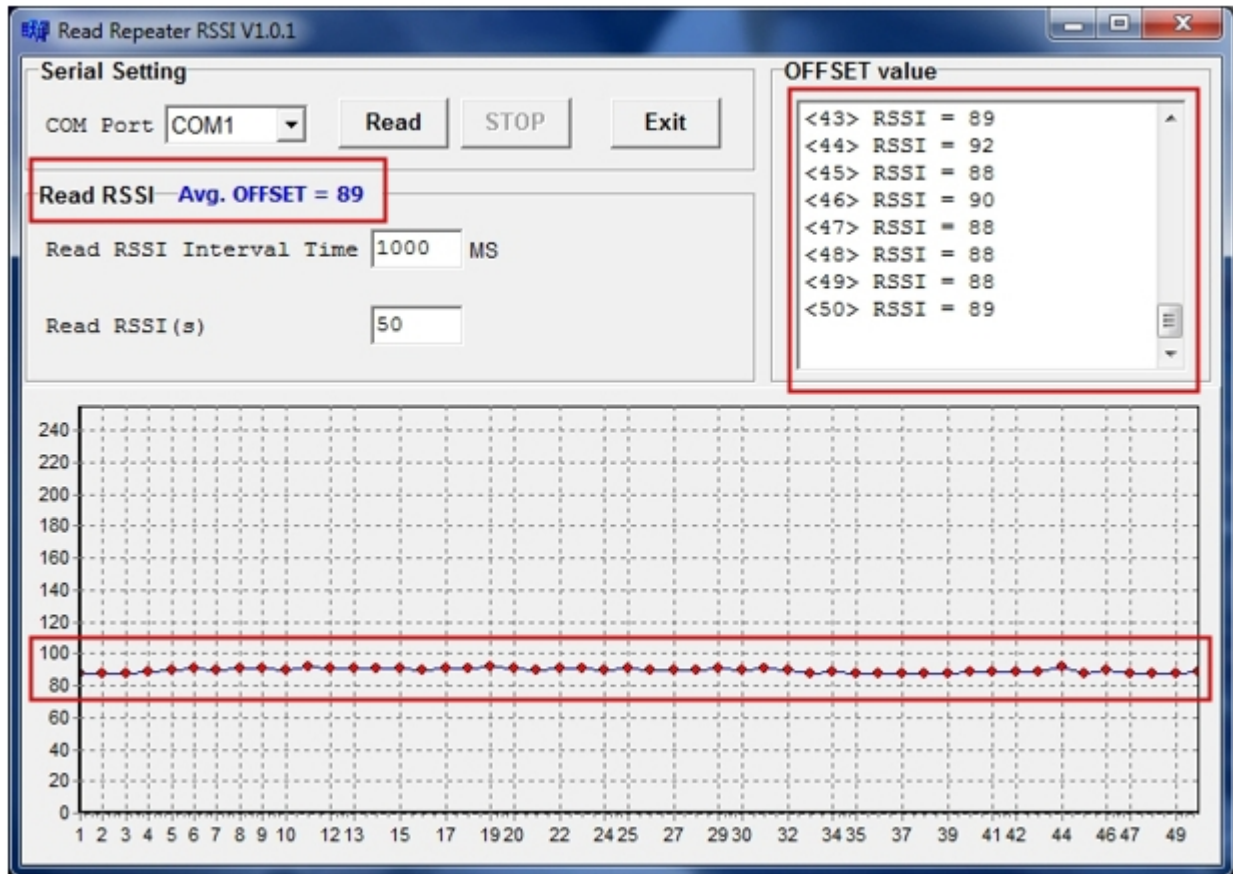

The RSSi Program will run thru Qty. of 50 "Reads" and give an Average Numeric Value.

## Apollo RP-125 Repeater

### How to get the New RSSi Value...Continued

Main RSSi Software Screen – Finished Reading

The RSSi Program has "Read 50 Times" and came up with "89" as the "Average Numeric" Value.

Take this New "Average Numeric" Value and "ADD" a Value of "10" to that Number.

Now the New RSSi Value will be "99" and this is what you would "Enter" into the RSSi Field.

## Apollo RP-125 Repeater

### Program the Repeater with the New RSSi Value

Close the RSSi Program and Open the RP-125 Repeater Program

"Link-up" and "Read" the Repeater

Repeater--C:\Program Files (x86)\Gold Apollo\Repeater\Bob Default.tbl

File Program About

Serial Setting  
COM Port: COM1 [Link] [Reset]

Frequency  
Range Of Frequency: 440 MHz - 470 MHz

Channel | Config

Channel 0  
RX: 4646250 00Hz TX: 4646250 00Hz Source: NB\_MOD Hi-Lo Power: Lo

Blocking Address  
 Blocking Address Enable  
Addr #1: 0608120 Addr #4: 1234567 Addr #7: 0000010 Addr #10: 0000009  
Addr #2: 0608992 Addr #5: 1234564 Addr #8: 0000050 Addr #11: 0100000  
Addr #3: 1234560 Addr #6: 1234565 Addr #9: 2097144 Addr #12: 1500000

Setting:  Invert Polarity(TX/RX) Baud Rate(TX/RX): 512 bps

Ready.....

Enter the New RSSi Value of "99" and "Write" (F4) to the Repeater, to Program in the New Value(s)

Delay: Delay #1: 0 \*250m sec. S\_RSSI: S\_RSSI: 99 Layer: 0 Command Address: 0617284

# WaveWare Technologies, Inc.

*"We Deliver Information at the Speed of Light"*

## **Apollo RP-125 Repeater**

---

### ***Name the New Program Data***

It is "Strongly Suggested" that you now "Save" this New Data as a Backup File.  
Save it under a Different Name than the Original File (maybe with the "RSSi Value"?)

---

### ***Test the Repeater with the New RSSi Value***

To Test the New Configuration just Send a Test Page from the Main Transmitter.  
The Pager should get Two Identical Paging Messages with 3- 4 Seconds between the Messages  
**(Unless you have the Pager Programmed Not to Display any Duplicate Messages for 30 Seconds)**  
If this is the case, then you can look at the Repeater and see if the Red TX LED Lights up.  
If so, then this is a Good Indicator that the Repeater is now Working as Expected

---

### ***Troubleshooting***

A Blinking Yellow LED (Not getting any Red LED for Transmission) usually means that the Repeater isn't Working with the RSSi Value Programmed and you will need to Check this Value.

**Note:** After Programming in a New RSSi Value, you "**Must Wait**" up to **15 Minutes** with the Repeater "**Powered-up**" before the Repeater is Ready to be used with the New Setting.

If you Do Not Wait long enough you will get the Yellow Blinking LED again.

### ***Technical Diagrams***

For Information about Why a Repeater may be needed and for Suggested Installation Ideas  
Please Review the Diagrams on the next 3 Pages, about Repeater Coverage.

**Both the SPS-5 and the Repeater are Considered "Transmitters".**

The Repeater will "Listen" for the Paging Signal from the Paging Transmitter. When it "Receives" a Paging Signal, it will then "Re-Send" or "Re-Transmit" (Repeat) the Paging Signal.

The Repeater should be Installed where it can Receive a "Good/Clean" Signal from the Paging Transmitter every time.

The Repeater will "Extend" the Paging Signal into Areas where the Original Paging Signal could Not Reach effectively and consistently.

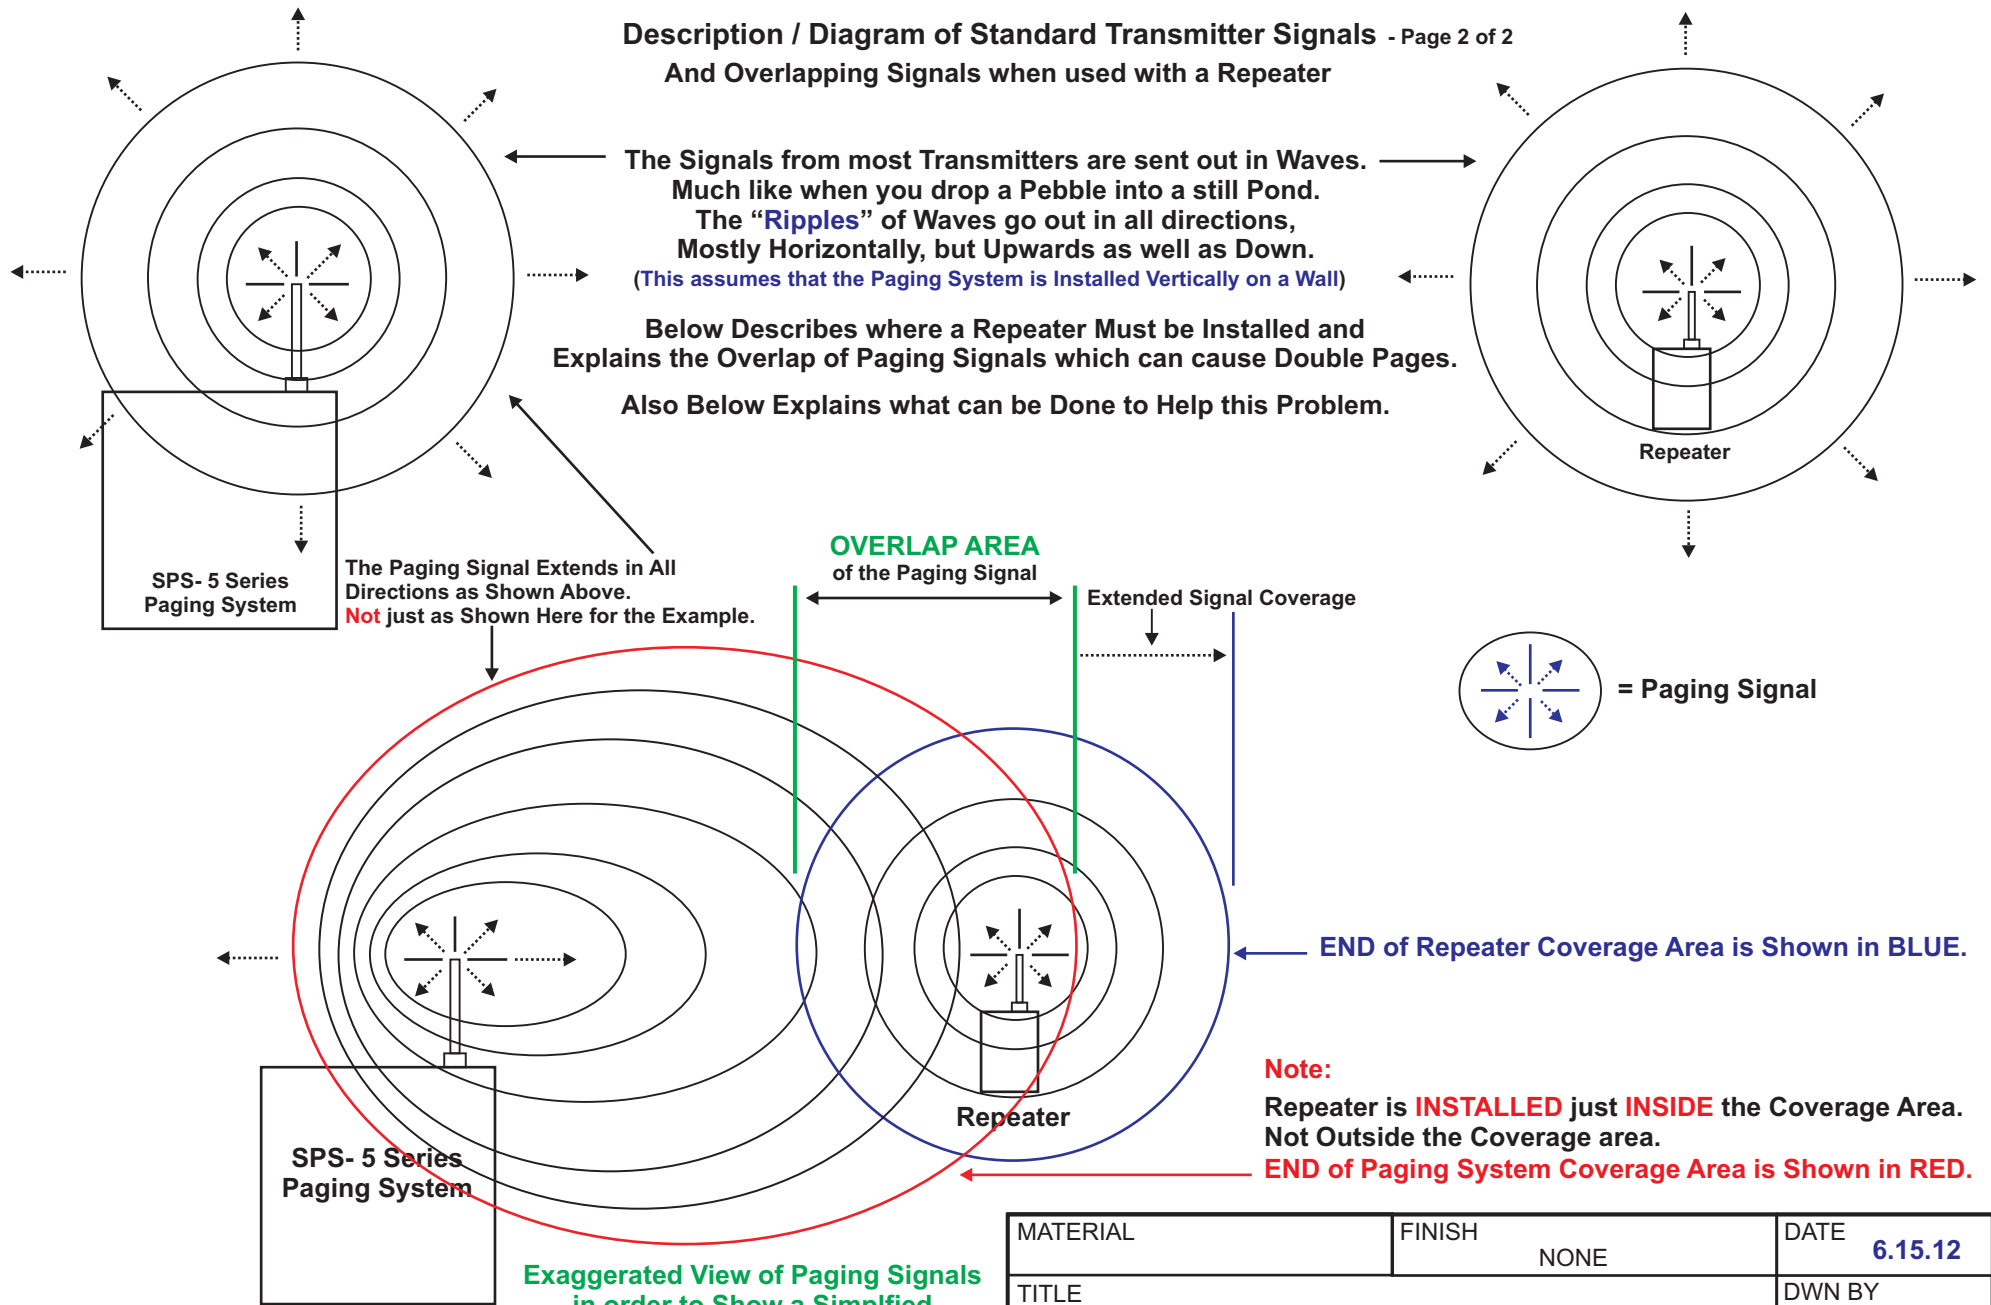

See Page 2 for an Explanation of Overlap Signals caused by using two Transmitters and what can done to help this Problem.

MATERIAL	FINISH NONE	DATE 6.15.12
TITLE Description of Transmitter used with a Repeater		DWN BY Bob Clyburn
WAVEWARE TECHNOLOGIES GARLAND, TEXAS 972-479-1702		APP. REV. 1

**Description / Diagram of Standard Transmitter Signals - Page 2 of 2**  
**And Overlapping Signals when used with a Repeater**

The Signals from most Transmitters are sent out in Waves. Much like when you drop a Pebble into a still Pond. The "Ripples" of Waves go out in all directions, Mostly Horizontally, but Upwards as well as Down. (This assumes that the Paging System is Installed Vertically on a Wall)

Below Describes where a Repeater Must be Installed and Explains the Overlap of Paging Signals which can cause Double Pages. Also Below Explains what can be Done to Help this Problem.

The Paging Signal Extends in All Directions as Shown Above. **Not** just as Shown Here for the Example.

**OVERLAP AREA**  
of the Paging Signal

Extended Signal Coverage

= Paging Signal

END of Repeater Coverage Area is Shown in BLUE.

**Note:**  
 Repeater is **INSTALLED** just **INSIDE** the Coverage Area. **Not** Outside the Coverage area.  
 END of Paging System Coverage Area is Shown in RED.

**Exaggerated View of Paging Signals**  
 in order to Show a Simplified  
 View of Signal Overlap.

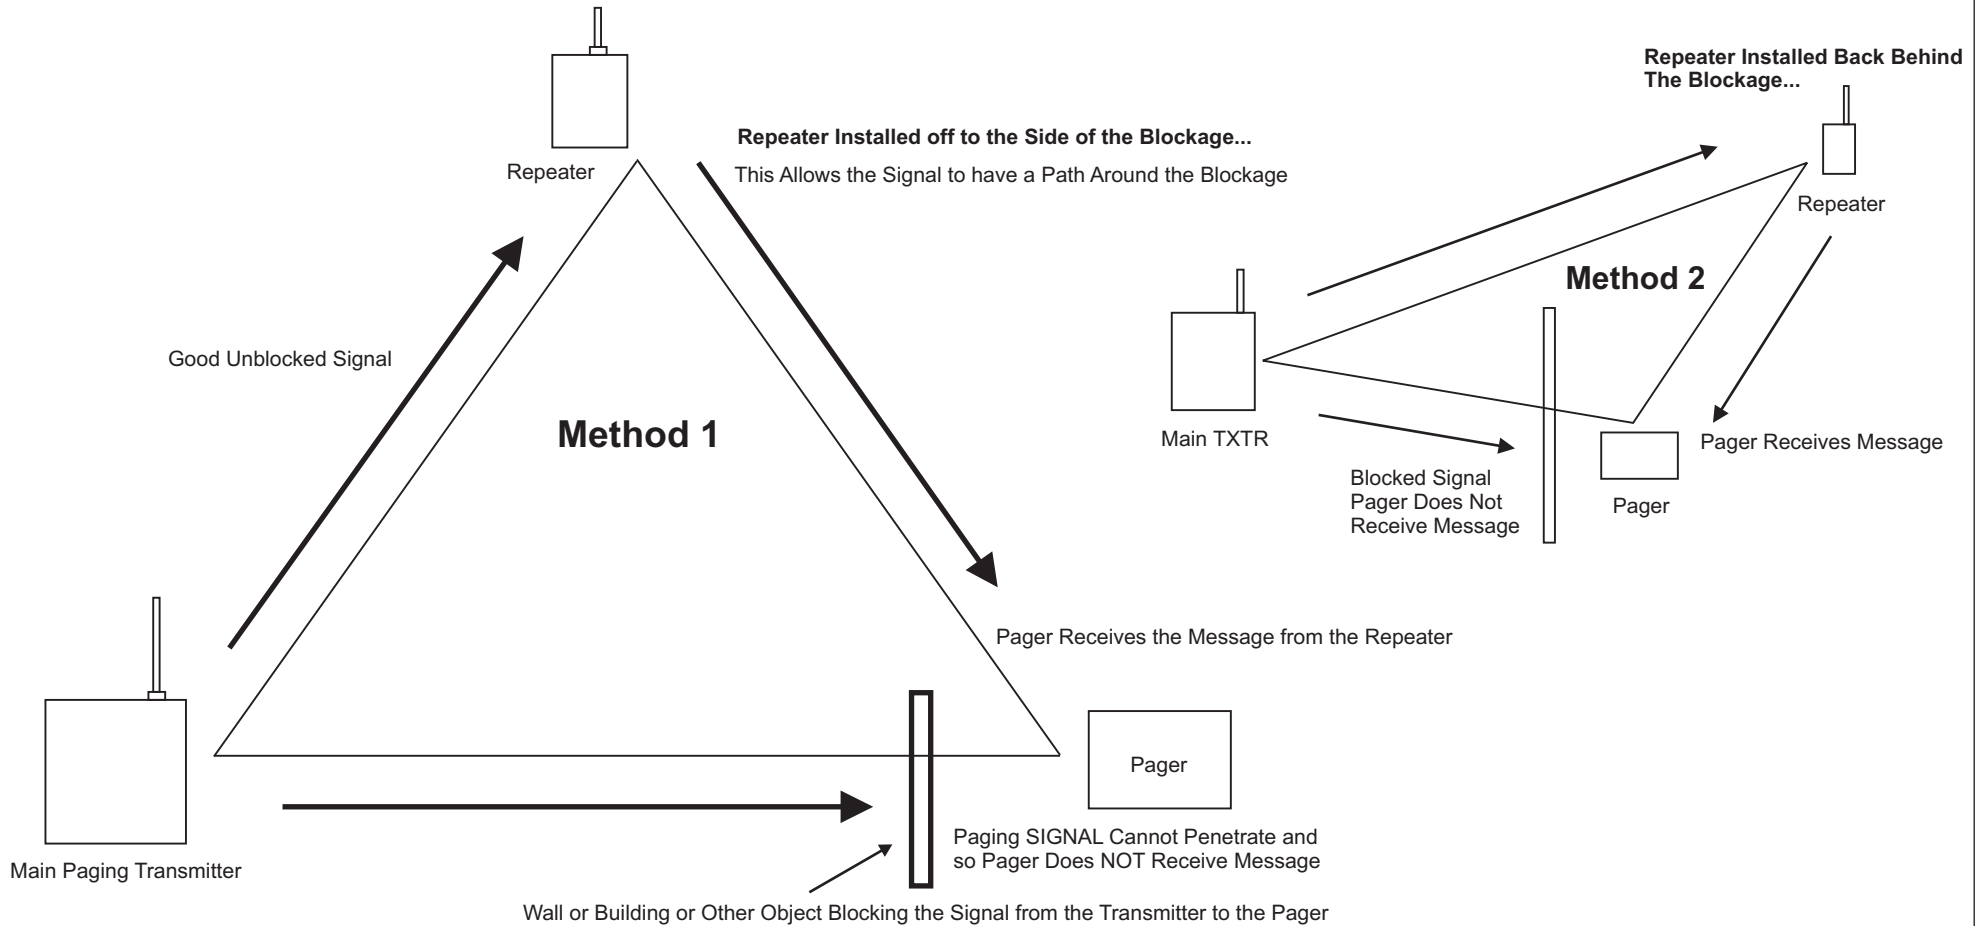

**Note:**  
 The Area of Overlapping Paging Signals will Cause Any Pager in the Overlap Area to get a Second Page, one from Both the Paging Transmitter and from the Repeater. If more than one Repeater is used, then any Pager within any of the Overlapping Signals will be Paged, so a Pager may get more than two Pages. **This Problem can be worked around by Re-Programming a Pager to Not Display any Duplicate Messages for 30 Seconds. This Change has to be Done using the Pager Software.**
